

Package ‘FlowSOM’

June 18, 2019

Version 1.16.0

Date 2017-03-22

Title Using self-organizing maps for visualization and interpretation of cytometry data

Author Sofie Van Gassen, Britt Callebaut and Yvan Saeys

Maintainer Sofie Van Gassen <sofie.vangassen@ugent.be>

Depends R (>= 3.2), igraph

Imports flowCore, ConsensusClusterPlus, BiocGenerics, tsne, XML, flowUtils

Suggests BiocStyle

Description FlowSOM offers visualization options for cytometry data, by using Self-Organizing Map clustering and Minimal Spanning Trees.

AddFlowFrame	<i>Add a flowFrame to the data variable of the FlowSOM object</i>
--------------	---

Description

Add a flowFrame to the data variable of the FlowSOM object

Usage

```
AddFlowFrame(fsom, flowFrame)
```

Arguments

fsom	FlowSOM object, as constructed by the ReadInput function
flowFrame	flowFrame to add to the FlowSOM object

Value

FlowSOM object with data added

See Also

[ReadInput](#)

AggregateFlowFrames *Aggregate multiple fcs files together*

Description

Aggregate multiple fcs files to analyze them simultaneously. A new fcs file is written, which contains about `cTotal` cells, with `ceiling(cTotal/nFiles)` cells from each file. Two new columns are added: a column indicating the original file by index, and a noisy version of this for better plotting opportunities (index plus or minus a value between 0 and 0.1).

Usage

```
AggregateFlowFrames(fileName, cTotal, writeOutput = FALSE,  
  outputFile = "aggregate.fcs", writeMeta = FALSE)
```

Arguments

<code>fileName</code>	Character vector containing full paths to the fcs files to aggregate
<code>cTotal</code>	Total number of cells to write to the output file
<code>writeOutput</code>	Whether to write the resulting flowframe to a file
<code>outputFile</code>	Full path to output file
<code>writeMeta</code>	If TRUE, files with the indices of the selected cells are generated

Value

This function does not return anything, but will write a file with about `cTotal` cells to `outputFile`

See Also

[ceiling](#)

Examples

```
# Define filename  
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")  
# This example will sample 2 times 500 cells.  
ff_new <- AggregateFlowFrames(c(fileName, fileName), 1000)
```

BuildMST *Build Minimal Spanning Tree*

Description

Add minimal spanning tree description to the FlowSOM object

Usage

```
BuildMST(fsom, silent = FALSE, tSNE = FALSE)
```

Arguments

<code>fsom</code>	FlowSOM object, as generated by BuildSOM
<code>silent</code>	If TRUE, no progress updates will be printed
<code>tSNE</code>	If TRUE, an alternative tSNE layout is computed as well

Value

FlowSOM object containing MST description

See Also

[BuildSOM](#), [PlotStars](#)

Examples

```
# Read from file, build self-organizing map
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
flowSOM.res <- ReadInput(fileName, compensate=TRUE, transform=TRUE,
                        scale=TRUE)
flowSOM.res <- BuildSOM(flowSOM.res, colsToUse=c(9,12,14:18))

# Build the Minimal Spanning Tree
flowSOM.res <- BuildMST(flowSOM.res)
```

BuildSOM

Build a self-organizing map

Description

Build a SOM based on the data contained in the FlowSOM object

Usage

```
BuildSOM(fsom, colsToUse = NULL, silent = FALSE, ...)
```

Arguments

<code>fsom</code>	FlowSOM object containing the data, as constructed by the ReadInput function
<code>colsToUse</code>	column names or indices to use for building the SOM
<code>silent</code>	if TRUE, no progress updates will be printed
<code>...</code>	options to pass on to the SOM function (<code>xdim</code> , <code>ydim</code> , <code>rlen</code> , <code>mst</code> , <code>alpha</code> , <code>radius</code> , <code>init</code> , <code>distf</code> , <code>importance</code>)

Value

FlowSOM object containing the SOM result, which can be used as input for the [BuildMST](#) function

References

This code is strongly based on the kohonen package. R. Wehrens and L.M.C. Buydens, Self- and Super-organising Maps in R: the kohonen package J. Stat. Softw., 21(5), 2007

See Also[ReadInput, BuildMST](#)**Examples**

```
# Read from file
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
flowSOM.res <- ReadInput(fileName, compensate=TRUE, transform=TRUE,
                        scale=TRUE)

# Build the Self-Organizing Map
# E.g. with gridsize 5x5, presenting the dataset 20 times,
# no use of MST in neighbourhood calculations in between
flowSOM.res <- BuildSOM(flowSOM.res, colsToUse=c(9, 12, 14:18),
                      xdim=5, ydim=5, rlen=20)

# Build the minimal spanning tree and apply metaclustering
flowSOM.res <- BuildMST(flowSOM.res)
metacl <- MetaClustering(flowSOM.res$map$codes,
                        "metaClustering_consensus", max=10)
```

computeBackgroundColor

Internal function for computing background nodes

Description

Internal function for computing background nodes

Usage

```
computeBackgroundColor(backgroundValues, backgroundColor,
                      backgroundLim = NULL, backgroundBreaks = NULL)
```

Arguments

backgroundValues Values to be used for background coloring, either numerical values or something that can be made into a factor (e.g. a clustering)

backgroundColor Colorpalette to be used for the background coloring . Can be either a function or an array specifying colors

backgroundLim Only used when backgroundValues are numerical. Defaults to min and max of the backgroundValues.

backgroundBreaks Breaks to pass on to [cut](#), to split numerical background values. If NULL, the length of backgroundColor will be used (default 100).

CountGroups

*Calculate differences in cell counts between groups***Description**

Calculate differences in cell counts between groups

Usage

```
CountGroups(fsom, groups, plot = TRUE, silent = FALSE, ...)
```

Arguments

fsom	FlowSOM object as generated by BuildSOM
groups	List containing an array with file names for each group
plot	Logical. If TRUE, make a starplot of each individual file
silent	Logical. If TRUE, print progress messages
...	Extra arguments to be passed on to the PlotStars function

Value

Distance matrix

See Also

[PlotStars](#), [PlotGroups](#)

Examples

```
library(FlowSOM)
set.seed(1)

# Build the FlowSOM tree on the example file
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
flowSOM.res <- FlowSOM(fileName, compensate=TRUE, transform=TRUE,
  scale=TRUE, colsToUse=c(9,12,14:18), nClus = 10)

# Have a look at the resulting tree
PlotStars(flowSOM.res[[1]], backgroundValues = as.factor(flowSOM.res[[2]]))

# Select all cells except the branch that corresponds with automated
# cluster 7 (CD3+ TCRyd +) and write to another file for the example
# In practice you would not generate any new file but use your different
# files from your different groups
ff <- flowCore::read.FCS(fileName)
ff_tmp <- ff[flowSOM.res[[1]]$map$mapping[,1] %in%
  which(flowSOM.res[[2]] != 7),]
flowCore::write.FCS(ff_tmp, file="ff_tmp.fcs")
# Make an extra file without cluster 7 and double amount of cluster 10
ff_tmp <- ff[c(which(flowSOM.res[[1]]$map$mapping[,1] %in%
  which(flowSOM.res[[2]] != 7)),
  which(flowSOM.res[[1]]$map$mapping[,1] %in%
```

```

                                which(flowSOM.res[[2]] == 5))),]
flowCore::write.FCS(ff_tmp, file="ff_tmp2.fcs")

# Compare the original file with the two new files we made
groupRes <- CountGroups(flowSOM.res[[1]],
                        groups=list("AllCells"=c(fileName),
                                    "Without_ydTcells"=c("ff_tmp.fcs", "ff_tmp2.fcs")))
PlotGroups(flowSOM.res[[1]], groupRes)

# Compare only the file with the double amount of cluster 10
groupRes <- CountGroups(flowSOM.res[[1]],
                        groups=list("AllCells"=c(fileName),
                                    "Without_ydTcells"=c("ff_tmp2.fcs")))
PlotGroups(flowSOM.res[[1]], groupRes)

```

Dist.MST	<i>Calculate distance matrix using a minimal spanning tree neighbourhood</i>
----------	--

Description

Calculate distance matrix using a minimal spanning tree neighbourhood

Usage

```
Dist.MST(X)
```

Arguments

X matrix in which each row represents a point

Value

Distance matrix

FlowSOM	<i>Run the FlowSOM algorithm</i>
---------	----------------------------------

Description

Method to run general FlowSOM workflow. Will scale the data and uses consensus meta-clustering by default.

Usage

```
FlowSOM(input, pattern = ".fcs", compensate = FALSE, spillover = NULL,
        transform = FALSE, toTransform = NULL,
        transformFunction = flowCore::logicleTransform(), scale = TRUE,
        scaled.center = TRUE, scaled.scale = TRUE, silent = TRUE, colsToUse,
        nClus = NULL, maxMeta, importance = NULL, seed = NULL, ...)
```

Arguments

input	a flowFrame, a flowSet or an array of paths to files or directories
pattern	if input is an array of file- or directorynames, select only files containing pattern
compensate	logical, does the data need to be compensated
spillover	spillover matrix to compensate with If NULL and compensate=TRUE, we will look for \$SPILL description in fcs file.
transform	logical, does the data need to be transformed with a logicle transform
toTransform	column names or indices that need to be transformed. If NULL and transform = TRUE, column names of \$SPILL description in fcs file will be used.
transformFunction	Defaults to logicleTransform()
scale	logical, does the data needs to be rescaled
scaled.center	see scale
scaled.scale	see scale
silent	if TRUE, no progress updates will be printed
colsToUse	column names or indices to use for building the SOM
nClus	Exact number of clusters for meta-clustering. If NULL, several options will be tried (1:maxMeta)
maxMeta	Maximum number of clusters to try out for meta-clustering. Ignored if nClus is specified
importance	array with numeric values. Parameters will be scaled according to importance
seed	Set a seed for reproducible results
...	options to pass on to the SOM function (xdim, ydim, rlen, mst, alpha, radius, init, distf)

Value

A list with two items: the first is the flowSOM object containing all information (see the vignette for more detailed information about this object), the second is the metaclustering of the nodes of the grid. This is a wrapper function for [ReadInput](#), [BuildSOM](#), [BuildMST](#) and [MetaClustering](#). Executing them separately may provide more options.

See Also

[scale](#), [ReadInput](#), [BuildSOM](#), [BuildMST](#), [MetaClustering](#)

Examples

```
# Read from file
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
flowSOM.res <- FlowSOM(fileName, compensate=TRUE, transform=TRUE,
                      scale=TRUE, colsToUse=c(9, 12, 14:18), maxMeta=10)
# Or read from flowFrame object
ff <- flowCore::read.FCS(fileName)
ff <- flowCore::compensate(ff, ff@description$SPILL)
ff <- flowCore::transform(ff,
                          flowCore::transformList(colnames(ff@description$SPILL),
                                                    flowCore::logicleTransform()))
flowSOM.res <- FlowSOM(ff, scale=TRUE, colsToUse=c(9, 12, 14:18), maxMeta=10)
```

```
# Plot results
PlotStars(flowSOM.res[[1]])

# Get metaclustering per cell
flowSOM.clustering <- flowSOM.res[[2]][flowSOM.res[[1]]$map$mapping[,1]]
```

FlowSOMSubset	<i>FlowSOM subset</i>
---------------	-----------------------

Description

Take a subset from a FlowSOM object

Usage

```
FlowSOMSubset(fsom, ids)
```

Arguments

fsom	FlowSOM object, as generated by BuildMST
ids	Array containing the ids to keep

Value

FlowSOM object containing updated data and median values, but with the same grid

See Also

[BuildMST](#)

Examples

```
# Read two files (Artificially, as we just split 1 file in 2 subsets)
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
ff1 <- flowCore::read.FCS(fileName)[1:1000,]
ff1@description$FIL <- "File1"
ff2 <- flowCore::read.FCS(fileName)[1001:2000,]
ff2@description$FIL <- "File2"

flowSOM.res <- FlowSOM(flowCore::flowSet(c(ff1,ff2)), compensate=TRUE,
                      transform=TRUE, scale=TRUE,
                      colsToUse=c(9,12,14:18), maxMeta=10)
fSOM <- flowSOM.res[[1]]

# see $metadata for subsets:
fSOM$metadata

# Use only the second file, without changing the map
fSOM2 <- FlowSOMSubset(fSOM,
                      (fSOM$metadata[[2]][1]):(fSOM$metadata[[2]][2]))
```

FMeasure	<i>F measure</i>
----------	------------------

Description

Compute the F measure between two clustering results

Usage

```
FMeasure(realClusters, predictedClusters, silent = FALSE)
```

Arguments

realClusters	Array containing real cluster labels for each sample
predictedClusters	Array containing predicted cluster labels for each sample
silent	Logical, if FALSE (default), print some information about precision and recall

Value

F measure score

Examples

```
# Generate some random data as an example
realClusters <- sample(1:5,100,replace = TRUE)
predictedClusters <- sample(1:6, 100, replace = TRUE)

# Calculate the FMeasure
FMeasure(realClusters,predictedClusters)
```

Initialize	<i>Select k well spread points from X</i>
------------	---

Description

Select k well spread points from X

Usage

```
Initialize(X, k)
```

Arguments

X	matrix in which each row represents a point
k	number of points to choose

Value

array containing indices of selected rows

MapDataToCodes	<i>Assign nearest node to each datapoint</i>
----------------	--

Description

Assign nearest node to each datapoint

Usage

```
MapDataToCodes(codes, newdata, distf = 2)
```

Arguments

codes	matrix with nodes of the SOM
newdata	datapoints to assign
distf	Distance function (1=manhattan, 2=euclidean, 3=chebyshev, 4=cosine)

Value

Array with nearest node id for each datapoint

MetaClustering	<i>MetaClustering</i>
----------------	-----------------------

Description

Cluster data with automatic number of cluster determination for several algorithms

Usage

```
MetaClustering(data, method, max = 20, nClus = NULL, ...)
```

Arguments

data	Matrix containing the data to cluster
method	Clustering method to use, given as a string. Options are metaClustering_consensus, metaClustering_hc, metaClustering_kmeans, metaClustering_som
max	Maximum number of clusters to try out
nClus	Exact number of clusters to use. If not NULL, max will be ignored.
...	Extra parameters to pass along

Value

Numeric array indicating cluster for each datapoint

See Also

[metaClustering_consensus](#)

Examples

```
# Read from file, build self-organizing map and minimal spanning tree
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
flowSOM.res <- ReadInput(fileName, compensate=TRUE, transform=TRUE,
                        scale=TRUE)
flowSOM.res <- BuildSOM(flowSOM.res, colsToUse=c(9, 12, 14:18))
flowSOM.res <- BuildMST(flowSOM.res)

# Apply metaclustering
metacl <- MetaClustering(flowSOM.res$map$codes,
                        "metaClustering_consensus",
                        max=10)

# Get metaclustering per cell
flowSOM.clustering <- metacl[flowSOM.res$map$mapping[, 1]]
```

metaClustering_consensus

MetaClustering

Description

Cluster data using hierarchical consensus clustering with k clusters

Usage

```
metaClustering_consensus(data, k = 7, seed = NULL)
```

Arguments

data	Matrix containing the data to cluster
k	Number of clusters
seed	Seed to pass to consensusClusterPlus

Value

Numeric array indicating cluster for each datapoint

See Also

[MetaClustering](#)

Examples

```
# Read from file, build self-organizing map and minimal spanning tree
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
flowSOM.res <- ReadInput(fileName, compensate=TRUE, transform=TRUE,
                        scale=TRUE)
flowSOM.res <- BuildSOM(flowSOM.res, colsToUse=c(9, 12, 14:18))
flowSOM.res <- BuildMST(flowSOM.res)
```

```
# Apply consensus metaclustering
metacl <- metaClustering_consensus(flowSOM.res$map$codes,k=10)
```

NewData

Map new data to a FlowSOM grid

Description

New data from a flowframe is mapped to an existing FlowSOM object. A new FlowSOM object is created, with the same grid, but a new mapping, node sizes and mean values. We assume the data is already compensated and transformed, but not scaled yet. The same scaling parameters as from the original grid will be used.

Usage

```
NewData(fsom, ff)
```

Arguments

fsom	FlowSOM object
ff	Flow frame with the data to map

Value

A new FlowSOM object

See Also

[FlowSOMSubset](#) if you want to get a subset of the current data instead of a new dataset

Examples

```
# Build FlowSom result
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
ff <- flowCore::read.FCS(fileName)
ff <- flowCore::compensate(ff, ff@description$SPILL)
ff <- flowCore::transform(ff,
  flowCore::transformList(colnames(ff@description$SPILL),
    flowCore::logicleTransform()))
flowSOM.res <- FlowSOM(ff[1:1000,], scale=TRUE, colsToUse=c(9,12,14:18),
  maxMeta=10)

# Map new data
fSOM2 <- NewData(flowSOM.res[[1]], ff[1001:2000,])
```

PlotCenters *Plot cluster centers on a 2D plot*

Description

Plot FlowSOM nodes on a 2D scatter plot of the data

Usage

```
PlotCenters(fsom, marker1, marker2, MST = TRUE)
```

Arguments

fsom	FlowSOM object, as generated by BuildMST
marker1	Marker to show on the x-axis
marker2	Marker to show on the y-axis
MST	Type of visualization, if 1 plot tree, else plot grid

Value

Nothing is returned. A 2D scatter plot is drawn on which the nodes of the grid are indicated

See Also

[PlotStars](#), [PlotPies](#), [PlotMarker](#), [BuildMST](#)

Examples

```
# Read from file, build self-organizing map and minimal spanning tree
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
flowSOM.res <- ReadInput(fileName, compensate=TRUE, transform=TRUE,
                        scale=TRUE)
flowSOM.res <- BuildSOM(flowSOM.res, colsToUse=c(9, 12, 14:18))
flowSOM.res <- BuildMST(flowSOM.res)

# Plot centers
PlotCenters(flowSOM.res, "FSC-A", "SSC-A")
PlotCenters(flowSOM.res, 2, 5)
```

PlotClusters2D *Plot nodes on scatter plot*

Description

Plot a 2D scatter plot. All cells of fsom\$data are plotted in black, and those of the selected nodes are plotted in red. The nodes in the grid are indexed starting from the left bottom, first going right, then up. E.g. In a 10x10 grid, the node at top left will have index 91.

Usage

```
PlotClusters2D(fsom, marker1, marker2, nodes, col = "#FF0000",
  maxBgPoints = 10000, pchBackground = ".", pchCluster = ".", main = "",
  xlab = fsom$prettyColnames[marker1], ylab = fsom$prettyColnames[marker2],
  xlim = c(min(fsom$data[, marker1]), max(fsom$data[, marker1])),
  ylim = c(min(fsom$data[, marker2]), max(fsom$data[, marker2])), ...)
```

Arguments

fsom	FlowSOM object, as generated by BuildMST
marker1	Marker to plot on the x-axis
marker2	Marker to plot on the y-axis
nodes	Nodes of which the cells should be plotted in red
col	Colors for all the cells in the selected nodes (ordered array)
maxBgPoints	Maximum number of background points to plot
pchBackground	Character to use for background cells
pchCluster	Character to use for cells in cluster
main	Title of the plot
xlab	Label for the x axis
ylab	Label for the y axis
xlim	Limits for the x axis
ylim	Limits for the y axis
...	Other parameters to pass on to plot

Value

Nothing is returned. A plot is drawn in which all cells are plotted in black and the cells of the selected nodes in red.

See Also

[PlotNumbers](#), [PlotCenters](#), [BuildMST](#)

Examples

```
# Read from file, build self-organizing map and minimal spanning tree
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
flowSOM.res <- ReadInput(fileName, compensate=TRUE, transform=TRUE,
  scale=TRUE)
flowSOM.res <- BuildSOM(flowSOM.res, colsToUse=c(9, 12, 14:18))
flowSOM.res <- BuildMST(flowSOM.res)

# Plot cells
PlotClusters2D(flowSOM.res, 1, 2, 91)
```

PlotGroups

*Plot differences between groups***Description**

Plot FlowSOM trees, where each node is represented by a star chart indicating mean marker values, the size of the node is relative to the mean percentage of cells present in each

Usage

```
PlotGroups(fsom, groups, view = "MST", tresh = 0.5, p_tresh = NULL,
           heatmap = FALSE, ...)
```

Arguments

fsom	FlowSOM object, as generated by BuildMST or the first list item of FlowSOM
groups	groups result as generated by CountGroups
view	Preferred view, options: "MST", "grid" or "tSNE" (if this option was selected while building the MST)
tresh	Relative difference in groups before the node is coloured
p_tresh	Threshold on p-value from wilcox-test before the node is coloured. If this is not NULL, tresh will be ignored.
heatmap	If TRUE, the scores are plotted in a gradient instead of only the selection that passes the threshold
...	Other parameters to pass to PlotStars

Value

A vector containing the labels assigned to the nodes for all groups except the first

See Also

[PlotStars](#), [CountGroups](#)

Examples

```
## Use the wrapper function to build a flowSOM object (saved in fsom[[1]])
## and a metaclustering (saved in fsom[[2]])
# fsom <- FlowSOM(ff,compensate = FALSE, transform = FALSE,scale = TRUE,
#               colsToUse = colsToUse, nClus = 10, silent = FALSE,
#               xdim=7, ydim=7)

## Make a list with for each group a list of files
## The reference group should be the first
# groups <- list("C"=file.path(workDir,grep("C",files,value = TRUE)),
#               "D"=file.path(workDir,grep("D",files,value=TRUE)))

## Compute the percentages for all groups
# groups_res <- CountGroups(fsom[[1]],groups)

## Plot the groups. For all groups except the first, differences with the
```

```
## first group are indicated
# annotation <- PlotGroups(fsom[[1]],groups_res)
```

PlotMarker

Plot marker values

Description

Plot FlowSOM grid or tree, coloured by node values for a specific marker

Usage

```
PlotMarker(fsom, marker = NULL, view = "MST", main = NULL,
  colorPalette = grDevices::colorRampPalette(c("#00007F", "blue", "#007FFF",
  "cyan", "#7FFF7F", "yellow", "#FF7F00", "red", "#7F0000")),
  backgroundValues = NULL, backgroundColor = function(n) {
  grDevices::rainbow(n, alpha = 0.3) }, backgroundBreaks = NULL,
  backgroundLim = NULL)
```

Arguments

fsom	FlowSOM object, as generated by BuildMST
marker	Name or index of marker to plot
view	Preferred view, options: "MST" (default), "grid" or "tSNE" (if this option was selected while building the MST)
main	Title of the plot
colorPalette	Color palette to use
backgroundValues	Values to be used for background coloring, either numerical values or something that can be made into a factor (e.g. a clustering)
backgroundColor	Colorpalette to be used for the background coloring . Can be either a function or an array specifying colors
backgroundBreaks	Breaks to pass on to cut , to split numerical background values. If NULL, the length of backgroundColor will be used (default 100).
backgroundLim	Only used when backgroundValues are numerical. Defaults to min and max of the backgroundValues.

Value

Nothing is returned. A plot is drawn in which each node is coloured depending on its median value for the given marker

flowSOM.res <- BuildMST(flowSOM.res)

# Plot one marker
PlotMarker(flowSOM.res, "FSC-A")
```

 PlotNode

Plot star chart

Description

Plot a star chart indicating median marker values of a single node

Usage

```
PlotNode(fsom, id, markers = fsom$map$colsUsed,
        colorPalette = grDevices::colorRampPalette(c("#00007F", "blue", "#007FFF",
        "cyan", "#7FFF7F", "yellow", "#FF7F00", "red", "#7F0000")),
        main = paste0("Cluster ", id))
```

Arguments

fsom	FlowSOM object, as generated by BuildMST or the first element of the list returned by FlowSOM
id	Id of the node to plot (check PlotNumbers to get the ids)
markers	Array of markers to use. Default: the markers used to build the tree
colorPalette	Colorpalette to be used for the markers
main	Title of the plot

Value

Nothing is returned. A plot is drawn in which the node is represented by a star chart indicating the median fluorescence intensities.

See Also

[PlotStars](#), [PlotNumbers](#), [FlowSOM](#)

Examples

```
# Read from file, build self-organizing map and minimal spanning tree
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
flowSOM.res <- FlowSOM(fileName, compensate=TRUE, transform=TRUE,
                      scale=TRUE, colsToUse=c(9, 12, 14:18), nClus=10)

# Plot stars indicating the MFI of the cells present in the nodes
PlotNode(flowSOM.res$FlowSOM, 1)
```

PlotNumbers

Plot the index of each node

Description

Plot FlowSOM grid or tree, with in each node a number indicating it's index

Usage

```
PlotNumbers(fsom, view = "MST", main = NULL, nodeSize = fsom$MST$size,
            backgroundValues = NULL, backgroundColor = function(n) {
  grDevices::rainbow(n, alpha = 0.3) }, backgroundLim = NULL,
            backgroundBreaks = NULL)
```

Arguments

fsom	FlowSOM object, as generated by BuildMST
view	Preferred view, options: "MST", "grid" or "tSNE" (if this option was selected while building the MST)
main	Title of the plot
nodeSize	Nodesize. The plot might be easier to read if this is a constant number, e.g. 10 or 15
backgroundValues	Values to be used for background coloring, either numerical values or something that can be made into a factor (e.g. a clustering)
backgroundColor	Colorpalette to be used for the background coloring . Can be either a function or an array specifying colors
backgroundLim	Only used when backgroundValues are numerical. Defaults to min and max of the backgroundValues.
backgroundBreaks	Breaks to pass on to cut , to split numerical background values. If NULL, the length of backgroundColor will be used (default 100).

Value

Nothing is returned. A plot is drawn in which each node is assigned a number

Examples

```
# Read from file, build self-organizing map and minimal spanning tree
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
flowSOM.res <- ReadInput(fileName, compensate=TRUE, transform=TRUE,
                        scale=TRUE)
flowSOM.res <- BuildSOM(flowSOM.res, colsToUse=c(9, 12, 14:18))
flowSOM.res <- BuildMST(flowSOM.res)

# Plot the node IDs
PlotNumbers(flowSOM.res)

# Adapt node size for easier readability
PlotNumbers(flowSOM.res, nodeSize=14)
```

PlotPies

*Plot comparison with other clustering***Description**

Plot FlowSOM grid or tree, with pies indicating another clustering or manual gating result

Usage

```
PlotPies(fsom, cellTypes, view = "MST",
        colorPalette = grDevices::colorRampPalette(c("white", "#00007F", "blue",
        "#007FFF", "cyan", "#7FFF7F", "yellow", "#FF7F00", "red")),
        backgroundValues = NULL, backgroundColor = function(n) {
        grDevices::rainbow(n, alpha = 0.3) }, backgroundLim = NULL,
        backgroundBreaks = NULL, legend = TRUE, main = "")
```

Arguments

fsom	FlowSOM object, as generated by BuildMST
cellTypes	Array of factors indicating the celltypes
view	Preferred view, options: "MST", "grid" or "tSNE" (if this option was selected while building the MST)
colorPalette	Colorpalette to be used for the markers
backgroundValues	Values to be used for background coloring, either numerical values or something that can be made into a factor (e.g. a clustering)
backgroundColor	Colorpalette to be used for the background coloring . Can be either a function or an array specifying colors
backgroundLim	Only used when backgroundValues are numerical. Defaults to min and max of the backgroundValues.
backgroundBreaks	Breaks to pass on to cut , to split numerical background values. If NULL, the length of backgroundColor will be used (default 100).
legend	Logicle, if T add a legend
main	Title of the plot

Value

Nothing is returned. A plot is drawn in which each node is represented by a pie chart indicating the percentage of cells present of each cell type. At the end, the layout is set to 1 figure again.

              "NK cells", "NKT cells")
gatingResult <- ProcessGatingML(ff_c, gatingFile, gateIDs, cellTypes)

# Plot pies indicating the percentage of cell types present in the nodes
PlotPies(flowSOM_res[[1]], gatingResult$manual)
```

plotStarLegend

Plot legend for star plot

Description

Plot a single star chart, annotated with labels

Usage

```
plotStarLegend(labels, colors = grDevices::rainbow(length(labels)),
              main = "")
```

Arguments

labels	Names to show in the legend
colors	Corresponding colors
main	Title of the legend

Value

Nothing is returned. A plot is drawn with 1 star chart, which is filled completely and annotated with the given labels.

See Also

[PlotStars](#)

PlotStars

Plot star charts

Description

Plot FlowSOM grid or tree, where each node is represented by a star chart indicating median marker values

Usage

```
PlotStars(fsom, markers = fsom$map$colsUsed, view = "MST",
  colorPalette = grDevices::colorRampPalette(c("#00007F", "blue", "#007FFF",
  "cyan", "#7FFF7F", "yellow", "#FF7F00", "red", "#7F0000")),
  backgroundValues = NULL, backgroundColor = function(n) {
  grDevices::rainbow(n, alpha = 0.3) }, backgroundLim = NULL,
  backgroundBreaks = NULL, thresholds = NULL, legend = TRUE,
  query = NULL, main = "")
```

Arguments

fsom	FlowSOM object, as generated by BuildMST
markers	Array of markers to use. Default: the markers used to build the tree
view	Preferred view, options: "MST", "grid" or "tSNE" (if this option was selected while building the MST)
colorPalette	Colorpalette to be used for the markers
backgroundValues	Values to be used for background coloring, either numerical values or something that can be made into a factor (e.g. a clustering)
backgroundColor	Colorpalette to be used for the background coloring . Can be either a function or an array specifying colors
backgroundLim	Only used when backgroundValues are numerical. Defaults to min and max of the backgroundValues.
backgroundBreaks	Breaks to pass on to cut , to split numerical background values. If NULL, the length of backgroundColor will be used (default 100).
thresholds	Optional. Array containing a number for each of the markers to be used as the split between high/low. If provided, the percentage of positive cells is indicated instead of the MFI
legend	Logical, if TRUE add a legend
query	Show a low/high profile for certain markers in the legend. See also QueryStarPlot
main	Title of the plot

Value

Nothing is returned. A plot is drawn in which each node is represented by a star chart indicating the median fluorescence intensities. Resets the layout back to 1 plot at the end.

PlotStars(flowSOM.res)
```

PlotVariable	<i>Plot a variable for all nodes</i>
--------------	--------------------------------------

Description

Plot FlowSOM grid or tree, coloured by node values given in variable

Usage

```
PlotVariable(fsom, variable, view = "MST", main = NULL,
            colorPalette = grDevices::colorRampPalette(c("#00007F", "blue", "#007FFF",
            "cyan", "#7FFF7F", "yellow", "#FF7F00", "red", "#7F0000")),
            symmetric = FALSE, lim = NULL, backgroundValues = NULL,
            backgroundColor = function(n) { grDevices::rainbow(n, alpha = 0.3) },
            backgroundLim = NULL, backgroundBreaks = NULL)
```

Arguments

fsom	FlowSOM object, as generated by BuildMST
variable	Vector containing a value for each node
view	Preferred view, options: "MST", "grid" or "tSNE" (if this option was selected while building the MST)
main	Title of the plot
colorPalette	Color palette to use
symmetric	Plot colours symmetric around zero
lim	Variable limits
backgroundValues	Values to be used for background coloring, either numerical values or something that can be made into a factor (e.g. a clustering)

backgroundColor Colorpalette to be used for the background coloring . Can be either a function or an array specifying colors

backgroundLim Only used when backgroundValues are numerical. Defaults to min and max of the backgroundValues.

backgroundBreaks Breaks to pass on to [cut](#), to split numerical background values. If NULL, the length of backgroundColor will be used (default 100).

Value

Nothing is returned. A plot is drawn in which each node is coloured depending on its value for the given variable

flowSOM.res <- BuildMST(flowSOM.res)

# Plot some random values
rand <- runif(flowSOM.res$map$nNodes)
PlotVariable(flowSOM.res, rand)
```

ProcessGatingML

Process a gatingML file

Description

Reads a gatingML file using the [flowUtils](#) library and returns a list with a matrix containing filtering results for each specified gate and a vector with a label for each cell

Usage

```
ProcessGatingML(flowFrame, gatingFile, gateIDs, cellTypes, silent = FALSE)
```

Arguments

flowFrame The flowFrame to apply the gating on

gatingFile The gatingML file to read

gateIDs Named vector containing ids to extract from the gatingML file to use in the matrix

cellTypes Cell types to use for labeling the cells. Should be a subset of the names of the gateIDs

silent If FALSE, show messages of which gates are being processed

Value

This function returns a list in which the first element ("matrix") is a matrix containing filtering results for each specified gate and the second element ("manual") is a vector which assigns a label to each cell

See Also

[PlotPies](#)

Examples

```
# Read the flowFrame
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
ff <- flowCore::read.FCS(fileName)
ff_c <- flowCore::compensate(ff, flowCore::description(ff)$SPILL)
flowCore::colnames(ff_c)[8:18] <- paste("Comp-",
                                       flowCore::colnames(ff_c)[8:18],
                                       sep="")

# Specify the gating file and the gates of interest
gatingFile <- system.file("extdata", "manualGating.xml",
                          package="FlowSOM")

gateIDs <- c( "B cells"=8,
              "ab T cells"=10,
              "yd T cells"=15,
              "NK cells"=5,
              "NKT cells"=6)

cellTypes <- c("B cells", "ab T cells", "yd T cells",
              "NK cells", "NKT cells")

gatingResult <- ProcessGatingML(ff_c, gatingFile, gateIDs, cellTypes)

# Build a FlowSOM tree
flowSOM.res <- FlowSOM(ff_c, compensate=FALSE, transform=TRUE,
                     toTransform=8:18, colsToUse=c(9,12,14:18), nClus=10)
# Plot pies indicating the percentage of cell types present in the nodes
PlotPies(flowSOM.res[[1]], gatingResult$manual)
```

Purity

Calculate mean weighted cluster purity

Description

Calculate mean weighted cluster purity

Usage

```
Purity(realClusters, predictedClusters, weighted = TRUE)
```

Arguments

realClusters array with real cluster values
 predictedClusters array with predicted cluster values
 weighted logical. Should the mean be weighted depending on the number of points in the predicted clusters

Value

Mean purity score, worst score, number of clusters with score < 0.75

Examples

```
# Generate some random data as an example
realClusters <- sample(1:5,100,replace = TRUE)
predictedClusters <- sample(1:6, 100, replace = TRUE)

# Calculate the FMeasure
Purity(realClusters,predictedClusters)
```

 QueryStarPlot

Query a certain cell type

Description

Identify nodes in the tree which resemble a certain profile of "high" or "low" marker expressions.

Usage

```
QueryStarPlot(fsom, query, plot = TRUE, color = "#ca0020", debug = FALSE,
  ...)
```

Arguments

fsom FlowSOM object, as generated by [BuildMST](#) or the first list item of [FlowSOM](#)
 query Array containing "high" or "low" for the specified column names of the FlowSOM data
 plot If true, a plot with a gradient of scores for the nodes is shown
 color Color to use for nodes with a high score in the plot
 debug If TRUE, some extra output will be printed
 ... Other parameters to pass to [PlotStars](#)

Value

A list, containing the ids of the selected nodes, the individual scores for all nodes and the scores for each marker for each node

Examples

```

file <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
# Use the wrapper function to build a flowSOM object (saved in fsom[[1]])
# and a metaclustering (saved in fsom[[2]])
fsom <- FlowSOM(file, compensate = TRUE, transform = TRUE, scale = TRUE,
               colsToUse = c(9,12,14:18), nClus = 10, silent = FALSE,
               xdim=7, ydim=7)
query <- c("PE-Cy7-A" = "high", #CD3
          "APC-Cy7-A" = "high", #TCRb
          "Pacific Blue-A" = "high") #CD8
query_res <- QueryStarPlot(UpdateNodeSize(fsom[[1]], reset=TRUE), query)

cellTypes <- factor(rep("Unknown",49), levels=c("Unknown", "CD8 T cells"))
cellTypes[query_res$selected] <- "CD8 T cells"
PlotStars(fsom[[1]],
          backgroundValues=cellTypes,
          backgroundColor=c("#FFFFFF00", "#ca0020aa"))

```

ReadInput

*Read fcs-files or flowframes***Description**

Take some input and return FlowSOM object containing a matrix with the preprocessed data (compensated, transformed, scaled)

Usage

```

ReadInput(input, pattern = ".fcs", compensate = FALSE, spillover = NULL,
          transform = FALSE, toTransform = NULL,
          transformFunction = flowCore::logicleTransform(), scale = FALSE,
          scaled.center = TRUE, scaled.scale = TRUE, silent = FALSE)

```

Arguments

input	a flowFrame, a flowSet or an array of paths to files or directories
pattern	if input is an array of file- or directorynames, select only files containing pattern
compensate	logical, does the data need to be compensated
spillover	spillover matrix to compensate with If NULL and compensate=TRUE, we will look for \$SPILL description in fcs file.
transform	logical, does the data need to be transformed
toTransform	column names or indices that need to be transformed. If NULL and transform=TRUE, column names of \$SPILL description in fcs file will be used.
transformFunction	Defaults to logicleTransform()
scale	logical, does the data needs to be rescaled
scaled.center	see scale
scaled.scale	see scale
silent	if TRUE, no progress updates will be printed

Value

FlowSOM object containing the data, which can be used as input for the BuildSOM function

See Also

[scale, BuildSOM](#)

Examples

```
# Read from file
fileName <- system.file("extdata", "lymphocytes.fcs", package="FlowSOM")
flowSOM.res <- ReadInput(fileName, compensate=TRUE, transform=TRUE,
                        scale=TRUE)

# Or read from flowFrame object
ff <- flowCore::read.FCS(fileName)
ff <- flowCore::compensate(ff, ff@description$SPILL)
ff <- flowCore::transform(ff,
                        flowCore::transformList(colnames(ff@description$SPILL),
                                                flowCore::logicleTransform()))
flowSOM.res <- ReadInput(ff, scale=TRUE)

# Build the self-organizing map and the minimal spanning tree
flowSOM.res <- BuildSOM(flowSOM.res, colsToUse=c(9, 12, 14:18))
flowSOM.res <- BuildMST(flowSOM.res)

# Apply metaclustering
metacl <- MetaClustering(flowSOM.res$map$codes,
                        "metaClustering_consensus", max=10)

# Get metaclustering per cell
flowSOM.clustering <- metacl[flowSOM.res$map$mapping[, 1]]
```

SaveClustersToFCS

Write FlowSOM clustering results to the original FCS files

Description

Write FlowSOM clustering results to the original FCS files

Usage

```
SaveClustersToFCS(fsom, original_files, pp_files = original_files,
                 selection_files = NULL, silent = FALSE)
```

Arguments

<code>fsom</code>	FlowSOM object as generated by BuildSOM
<code>original_files</code>	FCS files that should be extended
<code>pp_files</code>	FCS files that correspond to the input of FlowSOM
<code>selection_files</code>	Files indicating which cells of the original files correspond to the input files
<code>silent</code>	If FALSE (default), print some extra output

Value

Saves the extended fcs file as [originalName]_FlowSOM.fcs

SOM

Build a self-organizing map

Description

Build a self-organizing map

Usage

```
SOM(data, xdim = 10, ydim = 10, rlen = 10, mst = 1, alpha = c(0.05,
  0.01), radius = stats::quantile(nhbrdist, 0.67) * c(1, 0), init = FALSE,
  distf = 2, silent = FALSE, codes = NULL, importance = NULL)
```

Arguments

data	Matrix containing the training data
xdim	Width of the grid
ydim	Hight of the grid
rlen	Number of times to loop over the training data for each MST
mst	Number of times to build an MST
alpha	Start and end learning rate
radius	Start and end radius
init	Initialize cluster centers in a non-random way
distf	Distance function (1=manhattan, 2=euclidean, 3=chebyshev, 4=cosine)
silent	If FALSE, print status updates
codes	Cluster centers to start with
importance	array with numeric values. Parameters will be scaled according to importance

Value

A list containing all parameter settings and results

References

This code is strongly based on the kohonen package. R. Wehrens and L.M.C. Buydens, Self- and Super-organising Maps in R: the kohonen package J. Stat. Softw., 21(5), 2007

UpdateNodeSize *Update nodesize of FlowSOM object*

Description

Add size property to the graph based on cellcount for each node

Usage

```
UpdateNodeSize(fsom, count = NULL, reset = FALSE, transform = sqrt,
               maxNodeSize = 15, shift = 0, scale = NULL)
```

Arguments

fsom	FlowSOM object, as generated by BuildMST
count	Absolute cell count of the sample
reset	Logical. If TRUE, all nodes get the same size
transform	Transformation function. Use e.g. square root to let counts correspond with area of node instead of radius
maxNodeSize	Maximum node size after rescaling. Default: 15
shift	Shift of the counts, defaults to 0
scale	Scaling of the counts, defaults to the maximum of the value minus the shift. With shift and scale set as default, the largest node will be maxNodesize and an empty node will have size 0

Value

Updated FlowSOM object
